Description	Contractor
Engineers on the columnar query engine, working out whether the planned index structure can hold the latency target at all	No
Prototype test rigs consumed in the query engine benchmarks, scrapped afterwards	No
Paid to Delmore Research Partners to run the query planner experiments on our behalf, in their Austin lab	Yes
Engineers on the offline sync layer, resolving whether conflict resolution can be done client side at all	No
Handsets consumed in the sync experiments, destructively tested and scrapped	No
Paid to Isla Verde Labs to run the sync experiments on our behalf, at their San Juan site	Yes
Engineers rebuilding the ingestion pipeline, establishing whether a streaming design can hold the ordering guarantee	No
Cluster hardware consumed in the throughput trials	No
The Austin group on the same pipeline rewrite, establishing whether the ordering guarantee survives the schema migration	No
Paid to Ashvale Technologies to run the throughput experiments on our behalf, at their Bengaluru site	Yes
Engineers on the ranking model before the project was stopped, resolving whether the approach could hold precision at scale	No
Paid to Nordwytt Analytics for the precision trials on our behalf, invoiced before the stop	Yes
Engineers on the internal billing platform, working out whether the proration engine can reconcile mid cycle plan changes	No

Paid to Brackenhall Consulting to design and test the proration engine on our behalf	Yes
Engineers on the next generation radio stack, resolving whether it can hold the power budget	No
This year's depreciation on the RF chamber and the spectrum analysers, used only on the radio stack experiments	No
Radio modules and antennas consumed in the power budget trials, destroyed in testing	No
Bought two more spectrum analysers for the lab in December, not in service at year end, so nothing is being depreciated on them yet	No
Testing three candidate antenna layouts against each other to establish which design is the appropriate one for the next generation stack	No
Conformance testing of each production build of the console against the released design spec before it ships, to catch units that do not meet it	No
Engineers building a customer specific export adapter for Halbrook Freight, to the requirement Halbrook wrote	No
Engineers on the shipping console itself, resolving whether the query cache can be made to hold under peak load. Work on the same component that has been in commercial production since March 2024, not on a new one.	No
Surveying customers on which integrations they want next	No
Launch campaign for the export adapter	No
Engineers on the maritime telemetry work, establishing whether the satellite link can carry the sensor payload	No
Sensor buoys consumed in the sea trials	No

The second query engine team, resolving whether the vectorised executor can beat the row at a time path	No
This year's depreciation on the benchmark cluster, used only on the query engine experiments	No
The second sync team, working out whether background sync can survive the OS scheduler limits	No
The second pipeline team, resolving whether backpressure can be made stable under burst load	No
Load generators consumed in the proration trials	No
Paid to Delmore Research Partners for the power budget experiments on our behalf	Yes
Storage media consumed in the query engine benchmarks	No
GPU time and test corpora consumed in the ranking trials before the stop	No
Engineers on the ledger reconciliation logic, working out whether the double entry model can absorb retroactive plan changes	No
Conformance testing of shipped gateway units against the settled firmware spec on the production line, to catch units that do not meet it	No

Project	What it is
Ferncastle	Our internal billing and provisioning platform, built for our own use and never sold or licensed to anyone
Halcyon	The ingestion and streaming pipeline behind the Marbrook console
Larkfield	A new columnar query engine we intend to license to customers
Marbrook	The freight visibility console we sell
Ospreyline	The telemetry gateway. Two components: the current firmware, and the next generation radio stack.
Sandpiper	The mobile SDK and its offline sync layer
Tidewell	Maritime telemetry research
Wrenlow	Recommendation ranking for the Marbrook console

Status

In development, not released

In development, not released

In development, not released

In commercial production since March 2024. Shipping to customers on the standard price list. Gateway units have shipped to pilot customers since February 2025 and the production line builds them to the settled firmware spec. The next generation radio stack is a separate component, its design is not settled and it has never been produced or sold.

In development, not released

In development, not released

Stopped on 20 March 2025. The model was shelved, the code was deleted from the monorepo and the results were abandoned. Nothing from Wrenlow is in any shipping product and nothing will be.
